Plastic & board pots for ice-creams and yoghurt

In 2009 **PiberGroup** has introduced the production and sale of a composite pot made of plastic + board. The package consists of an internal pot made of clear PET (very light - between 5 and 7 g), completed by a cardboard on the outer part and on the bottom. The cardboard bears a high-definition offset-print in six colours on the outer part, but on request it can be printed also on the inside. The bottom is printed in one colour only. The range includes 150, 400 and 500 ml pots; on request any other size is possible. This package combines the feeling of high-quality printed cardboard to an even and regular seal, providing for perfect seal, peelability and high-speed sealing. The combination of the two materials provides a more rigid and solid package compared to plain cardboard or a simple thermoformed pot (very thin). The possibility of printing the inner side offers various communication possibilities. The container is suitable for processing on yoghurt packaging machines (95 mm in diameter), and application of aluminium covers and sealing caps. Consumers can separate the two materials, and the pot is disposed according to paper and not plastic regulations (Paper Conai Contribution).
